LAB JOURNAL: 02

Working with HTML5

Name: Talha Naveed

Enrollment: 01-131232-089

Section: BSE-6A

Instructor: Engr. Subas Bilal

Repository: **Lab 02**

February 3, 2026

1 Objective

The objective of this lab is to explore the transition from traditional HTML to the HTML5 standard. The lab focused on implementing semantic structural elements such as `<header>`, `<footer>`, `<article>`, and `<section>` to clearly define different parts of a web page. Additionally, native multimedia support was integrated using the `<audio>` and `<video>` elements.

2 Lab Tasks

2.1 Task 1: Famous Cities (Content Structuring)

In this task, an HTML5 document was created using semantic tags to structure information about London, Paris, and Tokyo. Each city's information was enclosed within an `<article>` element, representing independent content inside a broader `<section>`.

2.2 Task 2: Campus Visit Feedback Form

This task involved designing a university campus visit feedback form. The form includes text fields for personal information, checkboxes for campus features, and radio buttons for referral sources. The form submits user data using the `POST` method.

2.3 Task 3: Kindergarten Multimedia Hub

This task required the development of a multimedia-focused webpage for kindergarten students, containing both audio and video content.

- **Audio:** A national anthem audio clip with full playback controls.
- **Video:** A collection of five famous nursery rhymes.
- **Accessibility:** Image-based email contact with proper `alt` text and captions provided using the `<figcaption>` element.

3 Conclusion

In Lab 02, a strong understanding of HTML5 semantic structure was developed. Replacing generic tags with meaningful elements such as `<article>` and `<section>` improved clarity and accessibility. The integration of native audio and video elements demonstrated how modern web standards simplify multimedia handling without relying on third-party plugins. These concepts will prove useful in the future in order to develop a structured and professional web application.
